New method of using a first anti-viral peptide comprising a Theta-defensin peptide in an amphipathic Alpha-helical structure in a lipid environment for reducing the infectivity of a virus.

Disclosure; Page 10; 65pp; English.

peptide (I) comprising a theta-defensin peptide in an amphipathic alphanolical structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used to reduce virus growth, infectivity burden, shed, and development of anti-LIV activities, and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus infection in a subject harbouring a latent virus, controlling virus special protects subject (vs), reducing virus shed from a vs. reducing percentage of Vs in a Vs. reducing virus shed from a vs. reducing percentage of Vs in a population regardless of viral infection status, or inducing latency in a Vs. (b) reducing the infectivity of a virus, and (c) rendering virus shed from a vs. reducing the number contaminated tissue or fluid sample safe for use, or reducing the number of virus infections virus particles in a population of viruses. (MI) is useful for reducing the infectivity of a virus in sheep, cattle, horses, swine, cats, fewl and humans e.g. an enveloped virus infection humans e.g. an enveloped virus infection who is ministered to a patient who is immunosuppressed to a constant peptide is administered to a patient who is immunosuppressed to a subject who is anti-viral peptide is most preferably administered to a subject who is contaminated represents a rhesus monkely thet a virus. The present sequence represents a rhesus monkely thet a virus in peptide, which is given in the exemplification of the present invention The present invention describes a method (M1) of using a first anti-viral

Novel theta defensin analog useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate object.

Example 1; SEQ ID NO 3; 46pp; English.

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as AD035239-AD03527. The theta defeatiled in the claims or appearing as AD035239-AD035257. The theta defeatiled in the claims or appearing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of a microorganism in an environment such as food or growth or survival of a microorganism in an environment such as food or solution, an inanimate object comprising surface, or a mammal. The solution, an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present high antimicrobial activity and low haemolytic activity. The present sequence represents the rhesus monkey wild-type theta defensin RTD-3

the invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO3529-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of a microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or growth or survival of a microorganism in an environment such as food or old the product, as solution (e.g., contact lens solution, or eye wash solution), an innimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbistatic inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as the repetides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present

                                                                                                                                                                                                                                                                                              ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of a microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbistical inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from chartmalicrobial activity and low haemolytic activity. The present sequence represents a Rhesus theta defensin analogue peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO35257. The theta defensin nalogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of survival of microorganism as well as microbistatic inhibition of survival of microorganism as well as therapeutic agents, disinfectants, food preservatives, or medicaments.

The present invention describes a method (M1) of using a first anti-viral peptide (I) comprising a theta-defensin peptide in an amphipathic alphanelus althoughes in a lipid environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used to reduce virus growth, infectivity burden, shed, and development of anti-viral resistance. (I) can be used for inhibiting the growth and proliferation of a virus and so can be used for; (a) protecting or reating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus pread within a virally-infected subject (VS) reducing virus alted from a VS. reducing percentage of VS in a vS, reducing virus shed from a VS. reducing percentage of VS in a vS; (b) reducing virus shed from a virus infection status, or inducing latency in a VS; (b) reducing the infectivity of a virus; and (c) rendering virus-contaminated tissue or finid sample safe for use, or reducing the number of infectious virus particles in a population of viruses. (M1) is useful for reducing the infectivity of a virus in sheep, cattle, horses, swine, catts, fowl and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Anti-viral, viral infection, theta-defensin, lipid environment, amphipathic alpha-helical structure, virucide, anti-HIV, immunisation, viral growth inhibitor, viral proliferation inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New method of using a first anti-viral peptide comprising a Theta-defensin peptide in an amphipathic Alpha-helical structure in a lipid environment for reducing the infectivity of a virus.
The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theca defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents a Rhesus theta defensin analogue peptide.
                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              m

administered to a patient who is immunosuppressed or to a subject who is not infected with the virus, where the first anti-viral peptide is administered prior to or subsequent to the virus contacting the subject. The anti-viral peptide is most preferably administered to a subject who is chronically, latently or acutely infected with the virus. The present sequence represents a chimeric human/rhesus monkey thera defensin anti-viral peptide, which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides theta defensin peptides and analogues which have antimicrobial activity. They can be used in the treatment bacterial, viral, fungal, protozoan and helminthic infections, in disinfectants and as food preservatives
                                                                                                                                                                                                               Gaps

The present invention describes a method (M1) of using a first anti-viral peptide (I) comprising a theta-defensin peptide in an amphipathic alphabelic peptide (I) comprising a theta-defensin peptide in an amphipathic alphabelic structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used for inhibiting the growth and conce viral seasons. (I) can be used for inhibiting the growth and proliferation of a virus and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus in spread within a virally infected subject (VS). Reducing virus shed form a Viracian percentage of VS in a contaminated tissue or fluid sample safe for use, or reducing the number of infectious virus particles in a population of viruses. (M1) is useful for infectious virus particles in a population of viruses. (M1) is useful for for reducing the infectivity of a virus; and (c) rendering virus supported for a patient who is number of cats, fowl and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is administered prior to or subsequent to the virus contacting the subject. The anti-viral peptide is most preferably administered to a patient where the first anti-viral peptide is most preferably administered to a patient where the first anti-viral peptide is contacting the virus. The present sequence represents a thesus monkey there defensin anti-viral peptide, which is given in the exemplification of the present invention
                                                                                                                                                                                                   Anti-viral; viral infection; theta-defensin; lipid environment; amphipathic alpha-helical structure; virucide; anti-HIV; immunisation; viral growth inhibitor; viral proliferation inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New method of using a first anti-viral peptide comprising a Theta-defensin peptide in an amphipathic Alpha-helical structure in a lipid environment for reducing the infectivity of a virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tack B;

Unidentified

Cyclic defensin fragment.

```
The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroival infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is rheav monkey theta defensin, RTD1 peptide. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                   Retrocyclin; infection; sexually transmitted disease; gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; rhesus monkey; theta defensin 1A;

This invention describes a novel conjugate for treating prokaryotic infections which comprises a transport mediator for passage through the prokaryote call membrane and a compound, directed against a prokaryote prokaryote and intended for introduction into it. The prokaryote is a bacterium, especially one pathogenic in humans. The transport mediator is preferably a human peptide or protein, especially a phage-holin protein, its active fragment or variant or a defension. The introduced compound is a peptide nucleic acid (PNA) that inhibits a gene, especially one implicated in resistance to penicillin, terracycline, ampicillin or kanamych. The conjugate has the structure transport mediator-spacer-PNA where the spacer is linked to the transport mediator through a cileavable disulfide bridge. The conjugates are administered together with an antibiotic, by parenteral, transdermal or subcutaneous routes. The products of the invention have antibacterial activity and are used, especially in combination with antibiotics, for treating prokaryotic, specifically bacterial, infections, especially where the pathogen is resistant to at least one antibiotics and the antibiotics can entibiotic resistance gene where the PNA is directed against the antibiotic resistance gene: Where the PNA is directed against antibiotic resistance gene: Where the PNA is directed against entibiotic resistance gene: Where he PNA is directed against sequence represents a cyclic defensin fragment described in the very sequence represents a cyclic defensin fragment described in the current or the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New conjugate of transport mediator and active agent, useful for treating prokaryotic infections, especially by neutralizing antibiotic resistance

for preparing a composition for treatment and/or prevention of bacterseamia for binding bacterial products such as lipopolysaccharide bacteranial for binding bacterial products such as lipopolysaccharide of septic shock. RTD-1, isolated from immune cells of rhesus monkeys, has antibacterial, fungicide, virucide, immunomodulator and anticoagulant activity. RTD-1 inhibits microbial cell-wall biosynthesis and also binds to LPS and LTA. RTD-1 is useful for treatment and prevention of severe by viruses. RTD-1 combines four advantageous properties: a direct antimicrobial action, neutralisation of bacterial products (by binding), immunomodulation (reducing release of proinflammatory cytokines but increasing release of regulatory factors) and anticoagulant action, so provides a better and simpler treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes the novel use of rhesus theta defensin-1 (RTD-1)
                                                                                                                                                                                                                                                                                                                                                                                                            Use of rhesus theta defensin-1 for treating or preventing bacteremia and septic shock, also for binding bacterial products and as immunomodulator and anticoagulant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Monkey, Rhesus theta defensin, RTD-1; antimicrobial peptide; cyclic; antimicrobial; antiinflammatory; antibacterial; virucide; fungicide; food; contact less solution; eye wash solution; inflammatory response; microbicidal inhibition; microbistatic growth inhibition; disinfectant; food preservative; bacterial infection; viral infection; fungal infection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel ophthalmic solution comprising a prostaglandin of the F-series and an antimicrobial peptide. A solution of the invention has hypotensive and ophthalmological activity. The solution is useful for the treatment of increased intraccular pressure, such as prostaglandin and the antimicrobial peptide work synergistically, to provide beneficial reduction in the incidence of irritant and toxic side effects such as hyperaemia, irritation and inflammation of conjunctiva, coular call dysplasia, irritation and inflammation of conjunctiva, hyperplementation, associated with the prior art prostaglandin compositions. The present sequence represents an antimicrobial peptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        rhesus theta defensin-1; RTD-1; bacteraemia; lipopolysaccharide; LPS;

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO3523-ADO35257. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of a microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for whemolytic activity. The present sigh antimicrobial activity and low haemolytic activity. The present sequence represents the rhesus monkey wild-type theta defensin RTD-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Monkey; Rhesus theta defensin; RTD; antimicrobial peptide; antimicrobial; antinflammatory; antibacterial; virucide; fungicide; food; contact lens solution; eye wash solution; inflammatory response; microbicidal inhibition; microbistatic growth inhibition; disinfectant; food preservative; bacterial inflection; viral inflection; disinfectant; fungal infection; haemolytic activity.

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO35257. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting or order of solution, as folution (e.g., contact lens solution, or eye wash colution), an inanimate object compact lens solution, or eye wash colution, an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbiscial inhibition of growth. Thus the peptides are useful as incompact in the interpolation of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents a Rhesus theta defensin analogue peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Monkey, Rhesus theta defensin, RTD, antimicrobial peptide, antimicrobial, antinflammatory, antibacterial, virucide, fungicide, food, contact lans solution; eye wash solution, inflammatory response, microbicidal inhibition, microbistatic growth inhibition; disinfectant, food preservative, bacterial infection, viral infection; disinfectant, fungal infection; haemolytic activity.

                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or growth or survival of a microorganism in an environment such as food or obtained, an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as the repetides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensing have high antimicrobial activity and low haemolytic activity. The present

defaulted in the claims or appearing as AD035239-AD035257. The theta defaulted in the claims or appearing as AD035239-AD035257. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., context lens solution, or eye wash colution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of survival of microorganism as well as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from high annimicrobial activity and low haemolytic activity. The present

```
The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as AD035239-AD035257. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of the microorganism and is useful for reducing or inhibiting coupt of a microorganism in an environment such as food or food product, as colution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicadal inhibition of survival of microorganism as well as microbicadal inhibition of growth. Thus the peptides are useful as the reapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensins have they antimicrobial activity and low haemolytic activity. The present sequence is protein containing 2 copies of the rhesus monkey theta
Monkey, Rhesus theta defensin, RTD-1, antimicrobial peptide, antimicrobial, antiinflammatory, antibacterial; virucide, fungicide; food, contact lens solution, eye wash solution; inflammatory response, microbicidal inhibition, microbistatic growth inhibition; disinfectant; food preservative, bacterial infection, viral infection; disinfectant; fungal infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel theta defensin analog useful for reducing or inhibiting growth survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate

```
The present invention provides theta defensin peptides and analogues which have antimicrobial activity. They can be used in the treatment of bacterial, viral, fungal, protozoan and helminthic infections, in disinfectants and as food preservatives
                                                                                                                                                                                                                                                                                                                              30-JAN-2001; 2001US-0265270P

                                                                                                                                                                                        The present invention describes a method (MI) of using a first anti-viral peptide (I) comprising a theta-defensin peptide in an amphipathic alphabatical structure in a lipide environment for reducing the infectivity of a virus. (I) can have virucide and anti-HVV activities, and can be used to reduce virus growth, infectivity burden, shed, and development of antipartial resistance. (I) can be used for inhibiting the growth and proliferation of a virus and so can be used for; (a) protecting or reating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus in subject harbouring a latent virus, controlling virus speread within a virally-infected subject (VS), reducing virus latent virus, ontrolling virus shed from a VS, reducing percentage of VS in a population regardless of viral infection status, or inducing latency in a VS, (b) reducing the infectivity of a virus; and (c) rendering virus.

Contaminated tissue or fluid sample safe for use, or reducing the number of infections virus particles in a population of viruses. (MI) is useful for reducing the infectivity of a virus in sheep, cattle, horses, swine, cats, fowl and humans e.g. an enveloped virus infecting human such as a mannistered to a patient who is immunosuppressed or to a subject who is not infected with the virus, where the first anti-viral peptide is administered to a patient who is immunosuppressed or to a subject who is anti-viral peptide is administered prior to or subsequent to the virus contacting the subject. The anti-viral peptide is administered to a subject who is contacting the virus and human there a defensing anti-viral peptide is a human there defensing with the virus of the virus contacting the subject. The anti-viral peptide is a human there defensing anti-viral peptide is sequence represents a human there defensing anti-viral peptide is sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Retrocyclin, infection, sexually transmitted disease, gene therapy, HIV, human immunodeficiency virus, bacterial vaginosis, ophthalmic infection, antibiotic modelling, antimicrobial; human; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note= "Linked to amino acid at position 18 to form a cyclic structure"

of the invention are useful for preventing refroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              novel retrocyclin peptides. The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful for modelling and screening novel sequence is human retrocyclin peptide analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 retrocyclin; cyclic; primate; retroviral infection; circular minidefensin; antibacterial; virucide; vaccine; immunotherapy; microbial; viral; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated retrocyclin peptide, useful for preventing retroviral infections in cells susceptible to bacterial or viral infections or treating patients having the infections, such as HIV, sexually transmitted diseases, vaginosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page 24; 72pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human retrocyclin peptide, RC-100.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ADN08176 standard; peptide; 18

The invention relates to a novel isolated retrocyclin peptide. The invention further provides: a cyclic polypeptide; an isolated nucleic acid encoding a primate retrocyclin; a method for preventing retroviral infection in a cell by administering an effective dose of a circular corpusion of administering an effective dose of retrocyclin to the corpusions by administering an effective dose of retrocyclin to the microbial organisms by administering an effective dose of retrocyclin as a microbial organisms; a method for administering restrocyclin as a therapeutic agent to a patient with an established microbial or viral infection; and a method for administering retrocyclin as a prophylactic agent to prevent a microbial or viral infection in a patient at risk of developing such infection. The retrocyclin peptide can be used to treat a viral infection such as HIV-1. The retrocyclin peptide can be used to treat a viral infection and be used in immunotherapy. The peptide and polypeptides are useful as the invention. This sequence represents a retrocyclin microbial and viral infections. This sequence represents a retrocyclin cuch as the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          원
                                                                The present invention describes a method (MI) of using a first anti-viral computed (I) comprising a theta-defensin peptide in an amphipathic alphace (I) computating a theta-defensin peptide in an amphipathic alphact beliated structure in a lipid environment for reducing the infectivity of a virus. (I) can have virudide and anti-HIV activities, and can be used for inhibiting the growth and confideration of a virus and so can be used for inhibiting the growth and proliferation of a virus in fection, preventing recurrent viral confection in a subject harbouring a latent virus, controlling virus in subject harbouring a latent virus, controlling virus shed from a Virally-infected subject (VS), reducing virus latent viral burden in a VS, reducing virus shed from a VS, reducing percentage of VS in a virus and contraminated tissue or fluid sample safe for use, or reducing the number of the fortious virus particles in a population of viruses. (MI) is useful for reducing the infectivity of a virus; and (c) rendering virus of infectious virus particles in a population of viruses, waine, cars, fowl and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is administered prior to or subsequent to the virus contacting the subject. The anti-viral peptide is most preferably administered to a subject who is immunosuppressed or to a subject who is contacting the virus. The present contacting peptide is contacting the virus. The present contacting peptide is contacting peptide. Which is peptide virus in the exemplification of the present virus in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Retrocyclin, infection, sexually transmitted disease, gene therapy, HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note= "Linked to amino acid at position 18 to form a cyclic structure"

                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                  ઠે
                                                                                                                                                                                                                                                                               ö
                                                                                                                                             The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually retransmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Retrocyclin; infection; sexually transmitted disease; gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.

                                                                                                                                                                                              The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (buman immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Retrocyclin; infection; sexually transmitted disease; gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.

                                                                           The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiancy virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Monkey, Rhesus theta defensin, RTD, antimicrobial peptide, antimicrobial, antinflammatory, antibacterial, virucide, fungicide, food, contact lens solution, eye wash solution, inflammatory response, microbicidal inhibition, microbistatic growth inhibition, disinfectant, food preservative, bacterial infection, viral infection, disinfectant, fungal infection, haemolytic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a theta defensin analogue defined by formulae
                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel theta defensin analog useful for reducing or inhibiting growth survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate

defension analogue is useful for reducing or inhibiting growth or survival of amicroorganism in an envivionment capable of sustaining the growth or survival or survival of the microorganism and is useful for reducing or inhibiting converted to the microorganism and is useful for reducing or inhibiting prowth or survival of a microorganism in an environment such as food or food product, a solution (e.g., conteat lens solution), or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel isolated retrocyclin peptide. The invention further provides: a cyclic polypeptide; an isolated nucleic acid encoding a primate retrocyclin; a method for preventing retroviral infection in a cell by administering an effective dose of a circular minidefensin or retrocyclin to the cell; a method for killing microbial

organisms by administering an effective dose of retrocyclin to the microbial organisms; a method for administering restrocyclin as a therapeutic agent to a patient with an established microbial or viral infection; and a method for administering retrocyclin as a prophylactic agent to prevent a microbial or viral infection in a patient at risk of developing such infection. The retrocyclin peptide has antibacterial and virucide activities. The retrocyclin peptide can be used to treat a viral infection such as HIV-1. The retrocyclin peptide can be used as a vaccine and can be used in immnotherapy. The peptide and polypeptides are useful as therapeutic and prophylactic agents for treating and preventing microbial and viral infections. This sequence represents a retrocyclin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated retrocyclin peptides and cyclic polypeptides, useful as therapeutic and prophylactic agents for treating and preventing microbial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel isolated retrocyclin peptide. The invention further provides: a cyclic polypeptide; an isolated nucleic acid encoding a primate retrocyclin; a method for preventing retroviral infection in a cell by administering an effective dose of a circular minidefensin or retrocyclin to the cell; a method for killing microbial organisms by administering an effective dose of retrocyclin to the microbial organism; a method for administering restrocyclin to the microbial organism; a method for administering restrocyclin as a therapeutic agent to a patient with an established microbial or viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              retrocyclin, cyclic; primate; retroviral infection;

infection, and a method for administering retrocyclin as a prophylactic agent to prevent a microbial or viral infection in a patient at risk of developing such infection. The retrocyclin peptide has antibacterial and virucide activities. The retrocyclin peptide can be used to treat a viral infection such as HIV-1. The retrocyclin peptide can be used as a vaccine and can be used in immunotherapy. The peptide and polypeptides are useful as therapeutic and prophylactic agents for treating and preventing microbial and viral infections. This sequence represents a retrocyclin peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  rrocyclin peptides and cyclic polypeptides, useful as prophylactic agents for treating and preventing microbial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel isolated retrocyclin peptide. The invention further provides: a cyclic polypeptide; an isolated nucleic acid encoding a primate retrocyclin; a method for preventing retroviral infection in a cell by administering an effective dose of a circular minidefensin or retrocyclin to the cell; a method for killing microbial organisms by administering an effective dose of retrocyclin to the microbial organisms; a method for administering restrocyclin to a therapeutic agent to a patient with an established microbial or viral infection, and a method for administering retrocyclin as a prophylactic agent to prevent a microbial or viral infection in a patient at risk of developing such infection. The retrocyclin peptide has antibacterial and

virucide activities. The retrocyclin peptide can be used to treat a viral infection such as HIV-1. The retrocyclin peptide can be used as a vaccine and can be used in immunotherapy. The peptide and polypeptides are useful as therapeutic and prophylactic agents for treating and preventing microbial and viral infections. This sequence represents a retrocyclin peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or trating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present

Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Retrocyclin, infection, sexually transmitted disease, gene therapy, HIV, human immunodeficiency virus, bacterial vaginosis, ophthalmic infection, antibiotic modelling, antimicrobial, cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         "Linked to amino acid at position 18 to form a structure"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel isolated retrocyclin peptide. The invention further provides: a cyclic polypeptide, an isolated nucleic acid encoding a primate retrocyclin, a method for preventing retroviral infection in a cell by administering an effective dose of a circular organisms by administering an effective dose of retrocyclin to the microbial organisms; a method for administering nestrocyclin as a microbial organism; and a method for administering restrocyclin as a infection; and a method for administering restrocyclin as a prophylactic agent to apatient with an established microbial or viral infection, and a method for administering restrocyclin as a prophylactic developing such infection. The retrocyclin peptide has antibacterial and viral infection such as HIV-1. The retrocyclin peptide can be used to risea a viral infection such as HIV-1. The retrocyclin peptide can be used as a vaccine and can be used in immunotherapy. The peptide and polypeptides are useful as the prophylactic agents for treating and preventing microbial and viral infections. This sequence represents a retrocyclin peptide of the invention.

The invention relates to a novel isolated retrocyclin peptide. The invention further provides: a cyclic polypeptide, an isolated nucleic caid encoding a primate retrocyclin, a method for preventing retroviral infection in a cell by administering an effective dose of a circular corpanisms by administering an effective dose of retrocyclin to the cell, a method for killing microbial corpanisms, a method for administering restrocyclin to the microbial organisms, a method for administering restrocyclin as a cell infection, and a method for administering retrocyclin as a prophylactic agent to prevent a microbial or viral infection; and a method for administering retrocyclin as a prophylactic corpulation of the retrocyclin peptide has antibacterial and ceveloping such infection. The retrocyclin peptide can be used to treat a viral infection such as HIV-1. The retrocyclin peptide can be used as a vaccine cond can be used in immunotherapy. The peptide can be used as a vaccine and can be used in immunotherapy. The peptide and polypeptides are useful as therapeutic and prophylactic agents for treating and preventing microbial and viral infections. This sequence represents a retrocyclin peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated retrocyclin peptides and cyclic polypeptides, useful as therapeutic and prophylactic agents for treating and preventing microbial and viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   retrocyclin; cyclic; primate; retroviral infection;

The present invention describes a method (M1) of using a first anti-viral peptide (I) comprising a theta-defensin peptide in an amphipathic alphace peptide (I) comprising a theta-defensin peptide in an amphipathic alphace helical structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used for interaction of a virus and so can be used for inhibiting the growth and conce virus and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus infection in a virally-infected subject (VS), reducing virus band from a VS, reducing virus shed from a VS, reducing virus latency in a CS; (b) reducing the infectivity of a virus; and (c) rendering virus of virus and virus; and (c) rendering virus expendation regardless of viral infection status, or inducing latency in a CS; (b) reducing the infectivity of a virus; and (c) rendering virus of infectious virus particles in a population of viruses. (MI) is useful to rear four and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is administered prior to or subsequent to the virus contacting the subject. The anti-viral peptide is most preferably administered to a patient where the first anti-viral peptide is a most preferably administered to a patient where the first anti-viral peptide is corrunically, latently or acutely infected with the virus. The present sequence represents a rhesus monkey thete defensin anti-viral peptide, which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Retrocyclin; infection; sexually transmitted disease; gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.
                                                                                                                                                                                                                                           New method of using a first anti-viral peptide comprising a Theta-defensin peptide in an amphipathic Alpha-helical structure in a lipid environment for reducing the infectivity of a virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "Linked to amino acid at position 18 to form a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides theta defensin peptides and analogues which have antimicrobial activity. They can be used in the treatment of bacterial, viral, fungal, protozoan and helminthic infections, in disinfectants and as food preservatives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-viral, viral infection, theta-defensin, lipid environment, amphipathic alpha-helical structure, virucide, anti-HIV, immunisation, viral growth inhibitor, viral proliferation inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                         cyclic; bacterium; fungus; protozoan; food preservative; analogue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel theta defensin peptide with antimicrobial activity against bacteria, yeast, fungi, protozoa and viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immundeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated Killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated retrocyclin peptide, useful for preventing retroviral infections in cells susceptible to bacterial or viral infections or treating patients having the infections, such as HIV, sexually transmitted diseases, vaginosis.
                                                                                                                                                /note= "Linked to amino acid at position 1 to form cyclic structure"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

object.

```
The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of a microorganism in an environment such as food or growth or survival of a microorganism in an environment such as food or or solution, an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbistatic inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as the repetides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensing have bacterial, viral, fungal or other infection. The theta defensing have been antimicrobial activity and low haemolytic activity. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nign antimicrobial activity and low haemolytic activity. The present sequence represents the rhesus monkey wild-type theta defensin RTD-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 18 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
